                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 5, Application US/09411628

Sequence 5, Application US/09411628

Patent No. 6428994

GENERAL INFORMATION:

APPLICANT: University of Southern California

IITLE OF INVENTION: CDNA, GENOMIC, AND PREDICTED PROTEIN

IITLE OF INVENTION: SEQUENCES OF LEARNING-INDUCED KINASES

FILE REFERENCE: 13761-707

CURRENT APPLICATION NUMBER: US/09/411,628

CURRENT FILING DATE: 1999-10-01

EARLIER APPLICATION NUMBER: US 60/102,906

EARLIER FILING DATE: 1998-10-02

NUMBER OF SEQ ID NOS: 16

SOFTWARE: FastSEQ for Windows Version 4.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 251.8; DB 4;

US-09-093-522-9

Sequence 9, Application US/09093522

Patent No. 6015700

GENERAL INFORMATION:
APPLICANT: Limper, Andrew H.
APPLICANT: Leof, Edward B.
APPLICANT: Thomas, Charles F.
APPLICANT: Thomas, Charles F.
TITLE OF INVENTION: CDC2 PROTEIN KINASE FF
TITLE OF INVENTION: CARINII
NUMBER OF SEQUENCES: 26
CCRRESPONDENCE ADDRESS:
ADDRESSEE: Fish & Richardson P.C., P.A.
STREET: 60 South Sixth Street, Suite 330
CITY: Minneapolis
STATE: MN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Windows Version

US-09-266-225D-13

Sequence 13, Application US/09266225D

Patent No. 6573364

GENERAL INFORMATION:

APPLICANT: Nandabalan, Krishan

APPLICANT: Kingsmore, Stephen

APPLICANT: Tchernev, Velizar

TITLE OF INVENTION: Isolation and Characterization of Hei

TITLE OF INVENTION: Syndrome (HPS) Protein Complexes and

TITLE OF INVENTION: Interacting Proteins

FILE REFERENCE: 15966-523

Genome. 12, 673-677 (2001)

Normalization and subtraction of cap-trapper-selected cDNAs to prepare full-length cDNA libraries for rapid discovery of new genes. Genome Res. 10 (10), 1617-1630 (2000)

RIKEN integrated sequence analysis (RISA) system--384-format sequencing pipeline with 384 multicapillary sequencer. Genome Res. 10 (11), 1757-1771 (2000)

Computer-based methods for the mouse full-length cDNA encyclopedia: real-time sequence clustering for construction of a nonredundant cDNA library. Genome Res. 11 (2), 281-289 (2001) cDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Animal Research in Riken contributed to prepare mouse tissues.

Computational Analysis of Full-Length Mouse cDNAs Compared with Fuman Genome Sequences Mamm. Genome. 12, 673-677 (2001)

Normalization and subtraction of cap-trapper-selected cDNAs to prepare full-length cDNA libraries for rapid discovery of new genes. Genome Res. 10 (10), 1617-1630 (2000)

RIKEN integrated sequence analysis (RISA) system--384-format sequencing pipeline with 384 multicapillary sequencer. Genome Res. 10 (11), 1757-1771 (2000)

Computer-based methods for the mouse full-length cDNA encyclopedia: real-time sequence clustering for construction of a nonredundant cDNA library. Genome Res. 11 (2), 281-289 (2001)

CDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Animal Research in Riken contributed to prepare mouse tissues.

Tissues were provided by Kirk W. Beisel (Boys Town National Research Hospital 555 North 30th Street Omaha, NE 68131 USA ) whose assistance we gratefully acknowledge.

/constructed from 1 million independent clones. cDNA
synthesis was initiated using an oligo(dT) primer, using
methylated C in the first strand reaction.
/constructed from 1 million independent clones. cDNA
was blunted, ligated to NotI adapters, digested with EcoRI
/compatible sites of a custor modified MCS of the
pBluescript (KS+) vector. The library was normalized in 2
/counds using conditions adapted from Soares et al., PNAS
(1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6
(1996): 791, except that a significantly longer
reannealing hybridization was used."

//incf-Du1 is a normalized_cDNA library containing the following tissue(s): Primary Lung Epithelial Cells The following tissue(s): Primary Lung Epithelial Cells Tissue normalized containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, disgested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleoride used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)!B tail. The sequence tag for this library is GGTTGTAGC.

The human kinases share structural similarity with animal kinases, more particularly serine or threonine protein kinases. Human kinase cDNA is useful for the detection of mutant human kinase for the diagnosis of disease, and also as a therapeutic. It is useful for screening drugs effective in the treatment of symptomatic or phenotypic manifestations perturbing the normal function of NHP in the body. The NHP nucleotide sequences are useful for generation of antibodies, as reagents in diagnostic assays, for the intended of other cellular gene products related to human kinases, and as reagents in assays for screening compounds that are useful for treating mental, biological or medical disorders. NHP oligonucleotides are used as probes. The labelled NHP probes are used as primers in amplification sites that can be used in diagnostics and harman genomic library for identifying mutations within the exons, introns and splice sites that can be used in diagnostics and pharmacogenomics. Nucleotide construct encoding that functions as bioreactors in the body delivering a continuous supply of NHP to the body. Nucleotide constructs encoding functional NHPs are used in gene therapy for the

                                                                                                               The present sequence is a cDNA encoding novel human protein (NHP) known as human kinase. The human kinases share structural similarity with animal kinases, more particularly serine or threonine protein kinases. Human kinase cDNA is useful for the detection of mutant human kinase for the diagnosis of disease, and also as therapeutic. It is useful for screening drugs effective in the treatment of symptomatic or phenotypic manifestations perturbing the normal function of NHP in the body. The NHP nucleotide sequences are useful for generation of artibodies, as reagents in diagnostic assays, for the industriation of other cellular gene products related to human kinases, and as reagents in assays for screening compounds that are useful for treating mental, biological or medical disorders. NHP oligonucleotides are used as probes. The labelled NHP probes are useful for screening human genomic library for identifying polymorphisms and as primers in amplification assays to detect mutations within the exons, introns and splice sites that can be used in diagnostics and pharmacogenomics. Nucleotide constructs in vivo that functions as bioreactors in the body delivering a continuous supply of NHP to the body. Nucleotide constructs encoding functional NHPs are used in gene therapy for the modulation of NHP expression.

The present sequence is a cDNA encoding novel human protein

(NHP) known as human kinase. The human kinases share structural

similarity with animal kinases, more particularly serine or

threonine protein kinases. Human kinase cDNA is useful for the

detection of mutant human kinase for the diagnosis of disease,

and also as a therapeutic. It is useful for screening drugs

effective in the treatment of symptomatic or phenocypic

manifestations perturbing the normal function of NHP in the

body. The NHP nucleotide sequences are useful for generation of

antibodies, as reagents in diagnostic assays, for the

identification of other cellular gene products related to human

kinases, and as reagents in assays for screening compounds that

are useful for treating mental, biological or medical disorders.

NHP oligonucleotides are used as probes. The labelled NHP probes

are useful for screening human genomic library for identifying

polymorphisms and as primers in amplification assays to detect

mutations within the exons, introns and splice sites that can

be used in diagnostics and pharmacogenomics. Nucleotide construct

encoding NHP products are used to genetically engineer cells

in vivo that functions as bioreactors in the body delivering a

continuous supply of NHP to the body. Nucleotide constructs

encoding nor functions in the body. Nucleotide constructs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               used in gene

                                                                                                                                                                      õ
                                                                                                                                                                                                                     8
                                                                                                                                                                                                                                                                                                           The present invention relates to an isolated human kinase polypeptide (PKIN) or a biologically active/immunogenic fragment of PKIN. PKIN is useful for diagnosing, treating and preventing cancer (e.g., leukaemia, 17mphoma, melanoma), an immune disorder (e.g., acquired immunodeficiency syndrome (AIDS), Addison's disease, allergy, anaemia, asthma, Crohn's disease, rheumatoid arthritis), a growth and developmental disorder (e.g., atherosolerosis, hypertension, myocardial cardiovascular disorder (e.g., fatty liver, cholestasis, cardiovascular disorder (e.g., fatty liver, cholestasis, danaering techniques and to analyse the proteome of a tissue or cell type. PKIN is useful for creating knockin humanised animals or transgenic drug screening techniques and to analyse the proteome of a tissue or cell type. PKIN is useful for creating knockin humanised animals or transgenic animals to model human diseases, in somatic or germline gene therapy, to generate a transcript image of a tissue or cell type, for detecting chifferences in the chromosomal location due to translocation, inversion, grobes for mapping naturally occurring genomic sequences. PKIN is useful in southern or northern analysis, dot blot or other membrane-based technologies, in PCR technologies, in dipstick, pin, multiformat enzyme linked immunosorbent (ELISA)-like assays and in microarrays utilising tinked immunosorbent (ELISA)-like assays and in microarrays utilising present sequence is human PKIN-10 obbMa.

2003-040686/03 P-PSDB; ABU05290 New human diagnostic and therapeutic (DITHP) polynucleotides and polypeptides, useful for diagnosing, preventing or treating disease; e.g. cancer, AIDS, Parkinson's disease, or autoimmune/inflammatory e.g. cand diseases

Claim 1; Page 267; 331pp; English.

This invention relates to the cDNA and protein sequences of fifty six polynucleotides for diagnostics and therapeutics (DITHP). The human DITHP polynucleotides and polypeptides are useful for diagnosing, preventing or treating diseases associated with, as well as effects of exogenous compounds, on the expression of human molecules, such as cell proliferative diseases (e.g. cancer, arteriosclerosis atherosclerosis, proliferative diseases (e.g. cancer, autoimmune/inflammatory diseases (e.g. anaemia, asthma, autoimmune thyroiditis, Crohn's disease, diabetes mellitus, glomerulonephritis, gout, multiple sclerosis, rheumatory diseases; c.g. arthitis, uveitis, acquired immunodeficiency disease, AlDS; allergies, arthitis, uveitis, acquired immunodeficiency disease, AlDS; allergies, neurological disorders (e.g. stroke, Alzheimer's disease, dementia, mental retardation, Parkinson's disease, epilepsy), gastrointestinal (e.g. ulcer, cirrhosis), reproductive (e.g. infertility, endometricsis), endometrics, confections (e.g. bacterial, hyperlipidemia, obesity), connective tissue disorders (e.g. osteoporosis, Reiter's syndrome), or infections (e.g. bacterial, viral, fungal, parasitic, protezoal). The DITHP sequences may be used to generate hybridisation probes useful in chromosomal mapping of naturally occurring genomic sequences. They are also useful in diagnostic assays. The polynucleotides are useful as molecular weight markers, or as antigen to elicit an immune response. The present sequence represents a human diagnostics and therapeutics (DITHP) conaectory are also useful an immune response. The

The novel protein kinases have been identified as members of the tyrosine or serine/threonine kinase (PTK and STK) families. The polynuclectides or serine/threonine kinase (PTK and STK) families. The polynuclectides encoding protein kinase (PTK and STK) families. The polynuclectides encoding protein kinase expression. For example, they may be used in the inappropriate kinase expression. For example, they may be used to reat disease (e.g. atherosclerosis), metabolic disorders (e.g. diabetes), immune related diseases (e.g. rheumatoid arthritis), neurological disorders (e.g. schizophrenia), neurodegenerative disorders (e.g. diabetes), parkinson's disease), inflammatory disorders (e.g. asthma), infectious disease (e.g. HIV) and reproductive disorders (e.g. infertility).

Additionally, polynucleotides encoding protein kinases may be used for gene therapy and as DNA probes in diagnostic assays.

The protein kinase polypeptides may be used as antigens in the production of antibodies against the protein kinases and in assays to identify

is a human kinase. A polymorphism was identified in the 3' UTR of the present sequence. The human kinases share structural similarity with animal kinases, more particularly serine or threonine protein kinases. Human kinase cDNA is useful for the detection of mutant human kinase for the diagnosis of disease, and also as a therapeutic. It is useful for screening drugs effective in the treatment of symptomatic or phenotypic manifestations perturbing the normal function of NHP in the body. The NHP nucleotide sequences are useful for generation of antibodies, as reagents in diagnostic assays, for the identification of other cellular gene products related to human kinases, and as reagents in assays for screening compounds that are useful for screening human genomic library for identifying polymorphisms and as primers in amplification assays to detect mutations within the exons, introns and splice sites that can be used in diagnostics are used to genetically engineer cells in vivo that functions as bioreactors in the body delivering a continuous supply of NHP to the body. Nucleotide constructs encoding functional NHPs are used in gene therapy for the modularion of NHP canes are used in gene therapy for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated human kinase polynucleotide useful for generating antibodies, as reagents in diagnostic assays and for screening foompounds useful for treating mental, biological or medical dise

The invention relates to an isolated 14257 polypeptide and nucleic acid encoding it. The 14257 protein is a protein kinase that acts as a medulating agent in regulating a variety of cellular processes, including cell proliferation, differentiation, growth and division. The activity of the protein of the invention may be described as; cytostatic; osteopathic; hepatotropic; antidiabetic; neuroprotective; antiarthritic; dermatological; immunosuppressive; antiinflammatory; antiarthryrcid; antipsoriatic; ophthalmological; antiallergic; antiarthythmic; virucide; anorectic; metabolic; immunomodulator and antiarshythmic; virucide; anorectic; metabolic; immunomodulator and analgesic. The protein of the invention may act as a novel diagnostic target or therapeutic agent controlling certain disorders, for example kinase-associated or other 14257-associated disorders. These may include cellular proliferative disorders such as cancers e.g. acute lymphoblastic leviemia or Hodgkin's disease. Other disorders include bone metabolism disorders such as osteoporosis, disorders of the immune system, e.g. inflammatory, diabetes mellitus, osteoarthritis and asthma. Proteins of the invention may also be of use as therapeutic agents in cardiovascular disorders such as hypertension and coronary artery disease, and some endothelial cell disorders, including psoriasis. The current sequence represents a human kinase 14257 cDNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel disease detection and treatment molecular polypeptide (MDDT) which has anti-inflammatory, immunosuppressive, seteopathic, cytostatic, anti-HIV, haemostatic, nephrotropic, antianaemic, antipsoriatic and hepatotropic activity. The polynucleotide and the polypeptides of the invention can be used for gene therapy, protein replacement therapy and are useful for treating a variety of diseases or conditions. These polypeptides or polynucleotides are particularly useful for diagnosing, treating or preventing cell proliferative disorders (e.g. cancers including adenocarcinoma, leukaemia, lymphoma, melanoma, myeloma or sarcoma), anaemia, Crohn's disease, acquired immunodeficiency syndrome (AIDS), Goodpasture's syndromes, inflammation, osteoporosis, thrombocytopaenia, psoriasis or hepatitis. ABX34440-ABX34835 encode the MDDT polypeptides represented in the disclosure of the invention.

ABU11450-ABU11845, described in the disclosure of the invention.

isease,
                                                                                                                             The present sequence encodes a novel protein kinase. The rucleic acids and the protein kinases they encode may be used in the treatment and diagnosis of diseases associated with inappropriate kinase expression such as immune-related diseases and discorders, cardiovascular disease, neurodegenerative diseases and/or cancers. The nucleic acids and complementary sequences may also be used as DNA probes in diagnostic assays. The kinase polypeptides may be used as antigens in the product of antibodies of kinase expression and activity. Diseases related to down regulate kinase antibodies and kinase antagonists may also be used to down regulate kinase expression and activity. Diseases related to kinase expression and activity include rheumatoid arthritis, atherosclerosis, autcimmune disorders, cardiomyopathies, strokes, renal failure, number disorders, cardiomyopathies, strokes, renal failure, chronic inflammatory pelvic disease, multiple sclerosis, asthma, content of disorders, rhinitis, autoimmunity, diabetes, cancers and reproductive disorders.
                                                                                                                                                                                                                                               lisease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is a cDNA encoding novel human protein (NHP) known as human kinase. The human kinases share structural similarity with animal kinases, more particularly serine or threonine protein kinases. Human kinase cDNA is useful for the detection of mutant human kinase for the diagnosis of disease, and also as a therapeutic. It is useful for screening drugs effective in the treatment of symptomatic or phenotypic manifestations perturbing the normal function of NHP in the body. The NHP nucleotide sequences are useful for generation of antibodies, as reagents in diagnostic assays, for the identification of other cellular gene products related to human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   m
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Zambrowicz

kinases, and as reagents in assays for screening compounds that

are useful for treating mental, biological or medical disorders.

NHP oligonucleotides are used as probes. The labelled NHP probes

are useful for screening human genomic library for identifying

polymorphisms and as primers in amplification assays to detect

mutations within the exons, introns and splice sites that can

be used in diagnostics and pharmacogenomics. Nucleotide construct

encoding NHP products are used to genetically engineer cells

in vivo that functions as bioreactors in the body delivering a

continuous supply of NHP to the body. Nucleotide constructs

encoding functional NHPs are used in gene therapy for the

modulation of NHP expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is a cDNA encoding novel human protein

(NHP) known as human kinase. The human kinases share structural

similarity with animal kinases, more particularly sexine or

threonine protein kinases. Human kinase cDNA is useful for the

detection of mutant human kinase for the diagnosis of disease,
and also as a therapeutic. It is useful for screening drugs

effective in the treatment of symptomatic or phenotypic

manifestations perturbing the normal function of NHP in the

body. The NHP nucleotide sequences are useful for generation of

antibodies, as reagents in diagnostic assays, for the

continuediation of other cellular gene products related to human

kinases, and as reagents in assays for screening to a reagents in assays for screening mental, biological or medical disorders.

NHP oligonucleotides are used as probes. The labelled NHP probes

are useful for screening human genomic library for identifying

polymorphisms and as primers in amplification assays to detect

mutations within the exons, introns and splice sites that can

be used in diagnostics and pharmacogenomics. Nucleotide construct

cencoding NHP products are used to genetically engineer cells

in vivo that functions as bioreactors in the body delivering a

continuous supply of NHP to the body. Nucleotide constructs

cencoding functional NHPs are used in gene therapy for the

modulation of NHP expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence encodes a novel protein kinase. The nucleic acids and the protein kinases they encode may be used in the treatment and diagnosis of diseases associated with inappropriate kinase expression such as immune-related diseases and/or cancers, cardiovascular disease, neurodegenerative diseases and/or cancers. The nucleic acids and complementary sequences may also be used as DNA probes in diagnostic assays. The kinase polypeptides may be used as antigens in the production of antibodies of kinase expression and activity. Anti-kinase antibodies and kinase antagonists may also be used to down regulate kinase expression and activity include rheumatoid arthritis, atherosclerosis, autoimmune disorders, cardiomyopathies, strokes, renal failure, immune disorders, cardiomyopathies, chronic inflammatory bowel disease, oxidative-stress related disorders, chronic inflammatory bowel disease, chonic inflammatory bowel disease,

                                                                                                                                                                                                                                                                                                                            ABZ77126 to ABZ77165 encode the human protein kinases given in ABP96048 to ABP96087. The protein kinases have antiasthmatic, antiinflammatory, antidiabetic, antiparkinsonian, antimigraine, cardiant, cytostatic, immunosuppressive and vulnerary activities, and can be used in gene therapy. A protein kinase therapeutic agent from the present invention, particularly a protein kinase gene agonist or antagonist, can be used for treating a disease or condition associated with a protein kinase in an individual. These diseases include chronic obstructive pulmonary diseases (COPD), asthma, non-insulin dependent diabetes, Parkinson's disease, migraine, myocardial infarction, inflammatory bowel disease, autoimmune disorders (e.g. allograft rejection or graft vs. host disease), cancers (e.g. leukaemias) or wound granulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ಧಿಕ್ಕರಿ
                                                                                                                                  New protein kinase genes and polypeptides, useful for diagnosing diseases associated with a protein kinase, or in gene therapy fo treating e.g. Parkinson's disease, migraine, myocardial infarctiallograft rejection or cancers
